The title compound,  $C_{29}H_{33}NO_3$ , crystallizes with three molecules (*A*, *B* and *C*) in the asymmetric unit. They differ in the twist of the phenyl and benzene rings of the 1,1'-biphenyl ring with respect to the plane of the 1,4-dihydropyridine ring. In all three molecules, the 1,4-dihydropyridine ring adopts a distorted boat conformation. The cyclohexene ring has an envelope conformation in molecules *A* and *B*, while it exhibits a distorted half-chair conformation for both the major and minor components in the disordered molecule *C*. In the crystal, molecules are linked by C—H···O and N—H···O hydrogen bonds, forming layers parallel to (100) defining  $R_4^1(6)$  and *C*(7) graph-set motifs. Additional C—H···π interactions consolidate the layered structure. Between the layers, van der Waals interactions stabilize the packing, as revealed by Hirshfeld surface analysis. The greatest contributions to the crystal packing are from H···H (69.6% in *A*, 69.9% in *B*, 70.1% in *C*), C···H/H···C (20.3% in *A*, 20.6% in *B*, 20.3% in *C*) and O···H/H···O (8.6% in *A*, 8.6% in *B*, 8.4% in *C*) interactions.

## 1. Chemical context

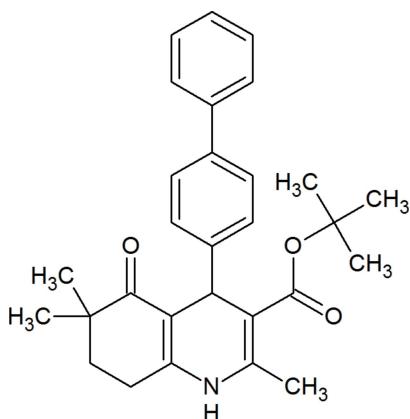

Chronic diseases are among the most common causes of death in the world, accompanied by difficulties and costs in treatment and health care. Therefore, preventing or treating chronic diseases is of paramount importance (Raghupathi & Raghupathi, 2018). Recent advances have shown that many diseases such as cancer, atherosclerosis or neurodegenerative diseases are triggered by inflammation (Furman *et al.*, 2019). Based on these findings, regulating inflammatory mediators and pathways has been suggested as a treatment strategy (Kany *et al.*, 2019).

Inflammatory stimuli that cause chronic inflammation initiate the production of inflammatory mediators such as interleukin-1 $\beta$  (IL-1 $\beta$ ), interleukin-6 (IL-6) and tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) as a result of the activation of signaling pathways. Receptors activated by inflammatory mediators induce chronic inflammation by various signaling pathways (nuclear factor  $\kappa$ -B (NF- $\kappa$ B), Janus kinase (JAK), signal transducer and activator of transcription (STAT)).

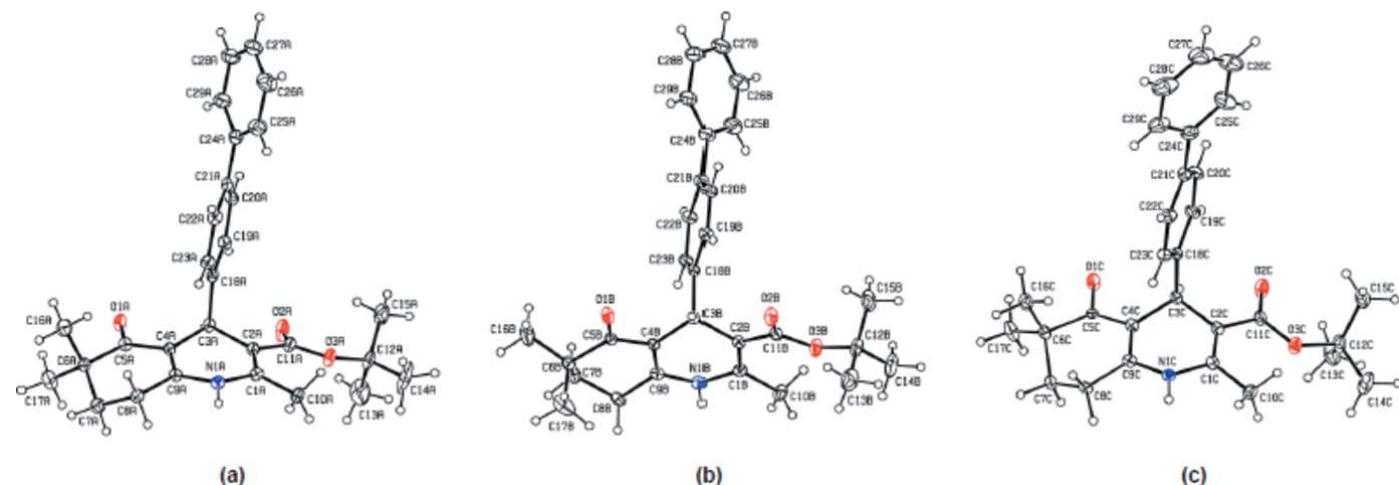

Inhibiting these pathways may be a promising approach for the treatment of chronic diseases associated with inflammation (Chen *et al.*, 2018).

Nifedipine, the first drug with a 1,4-dihydropyridine (1,4-DHP) ring, was introduced as a therapeutic agent as a result of intensive studies. The success of nifedipine as an anti-hypertensive drug has led to further studies and the discovery of other 1,4-DHP derivatives (De Luca *et al.*, 2019). Numerous compounds were obtained through modifications with respect to the 1,4-DHP ring. These studies also uncovered the idea of obtaining hexahydroquinoline derivatives by condensation of the 1,4-DHP scaffold with the cyclohexane ring system (Bladen *et al.*, 2014). In recent years, it has been found that 1,4-DHP and quinoline analogs have the potential to inhibit inflammation mediators and pathways, along with various other pharmacological activities (Costa *et al.*, 2010; Langle *et al.*, 2015; Kim *et al.*, 2018; Çetin *et al.*, 2022).

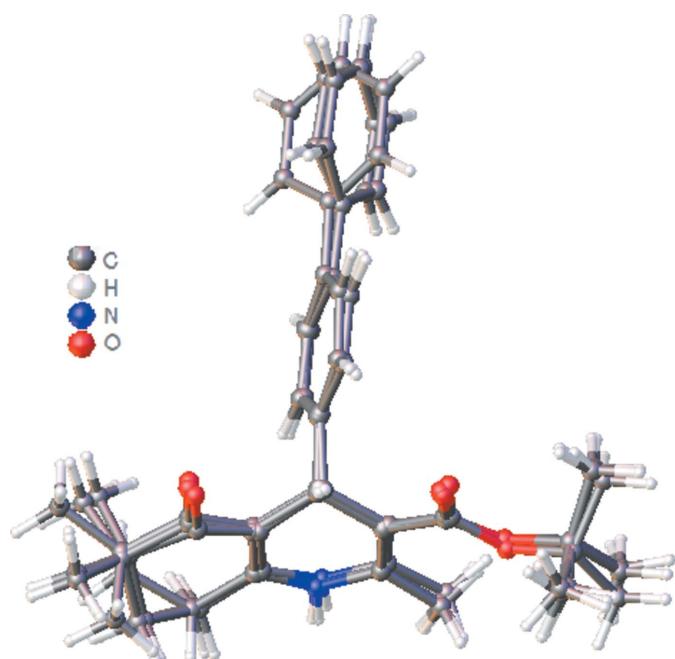

In the current study, *tert*-butyl 4-[(1,1'-biphenyl)-4-yl]-2,6,6-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate was obtained by condensation of the 1,4-DHP ring with a substituted cyclohexane ring using a modified Hantzsch method. The molecular structure of the compound was confirmed by spectroscopic methods such as IR,  $^1\text{H}$  NMR,  $^{13}\text{C}$

NMR, and its composition by elemental analysis. In addition, single-crystal X-ray analysis was performed to elucidate the crystal structure of the compound. Independent of the current study, biological activity studies of the title compound are ongoing.

C). They mainly differ in the twist of the phenyl (C24–C29) and benzene (C18–C23) rings of the 1,1'-biphenyl ring with respect to the plane of the 1,4-dihydropyridine ring (N1/C1–C4/C9). The corresponding dihedral angles amount to 89.26 (16) and 75.83 (19) $^\circ$  in molecule A, 88.34 (17) and 71.7 (2) $^\circ$  in molecule B, and 89.38 (17) and 83.6 (3) $^\circ$  in molecule C. The phenyl and benzene rings of the 1,1'-biphenyl ring make dihedral angles of 39.05 (19) $^\circ$  in A, 46.9 (2) $^\circ$  in B, and 33.5 (2) $^\circ$  in C. Fig. 2 shows an overlay plot of molecules A, B and C, with an r.m.s. deviation of 0.725  $\text{\AA}$ . Except for the atoms of the minor part of the disordered molecule C and the phenyl ring of the biphenyl group, the other atoms of molecule C and all atoms of molecules A and B are quite compatible and coincide with each other.

In all three molecules, the 1,4-dihydropyridine ring adopts a distorted boat conformation with puckering parameters (Cremer & Pople, 1975)  $Q_T = 0.269$  (4)  $\text{\AA}$ ,  $\theta = 104.5$  (9) $^\circ$  and  $\varphi = 357.4$  (9) $^\circ$  in A,  $Q_T = 0.257$  (4)  $\text{\AA}$ ,  $\theta = 73.1$  (9) $^\circ$  and  $\varphi = 176.0$  (9) $^\circ$  in B, and  $Q_T = 0.303$  (4)  $\text{\AA}$ ,  $\theta = 106.9$  (8) $^\circ$  and  $\varphi = 356.2$  (8) $^\circ$  in C. The cyclohexene ring (C4–C9) has an envelope conformation in molecules A and B [the puckering parameters are  $Q_T = 0.430$  (4)  $\text{\AA}$ ,  $\theta = 49.3$  (5) $^\circ$  and  $\varphi = 182.3$  (7) $^\circ$  in A, and  $Q_T = 0.439$  (4)  $\text{\AA}$ ,  $\theta = 58.8$  (5) $^\circ$  and  $\varphi = 179.9$  (6) $^\circ$  in B], while the major and minor components of the disordered cyclohexene rings in C exhibit a distorted half-chair conformation, with puckering parameters of  $Q_T = 0.451$  (9)  $\text{\AA}$ ,  $\theta = 44.7$  (12) $^\circ$  and  $\varphi = 161$  (2) $^\circ$  for the major component, and of  $Q_T = 0.44$  (2)  $\text{\AA}$ ,  $\theta = 50$  (3) $^\circ$  and  $\varphi = 206$  (5) $^\circ$  for the minor component.

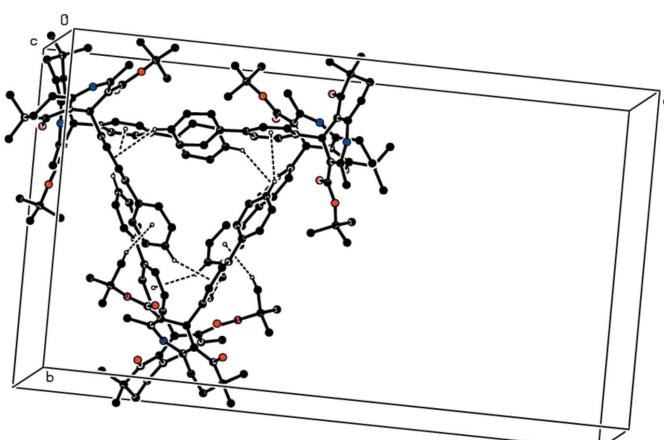

Bond lengths and angles in the three molecules of the title compound are comparable with those of closely related structures detailed in section 5 (Database survey).

### 3. Supramolecular features

In the crystal, molecules are linked by C–H···O and N–H···O hydrogen bonds (Table 1, Fig. 3), forming layers parallel to (100), defining  $R_4^1(6)$  and  $C(7)$  graph-set motifs (Bernstein *et al.*, 1995). Additional C–H··· $\pi$  interactions consolidate the layered arrangement (Table 1; Fig. 4). Between the layers, van der Waals interactions stabilize the packing, as revealed by Hirshfeld surface analysis.

### 4. Hirshfeld surface analysis

*Crystal Explorer* 17.5 (Spackman *et al.*, 2021) was used to construct Hirshfeld surfaces for the three independent molecules; the disorder of molecule C was included in the calculations. The  $d_{\text{norm}}$  mappings for molecule A were performed in the range –0.5982 to +2.4710 a.u., for molecule B in the range

## 5. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.42, update of September 2021; Groom *et al.*, 2016) for similar structures with the 1,4,5,6,7,8-hexahydroquinoline unit revealed seven closely related entries: ethyl 4-(4-bromophenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [CSD refcode LOQCAX (**I**); Steiger *et al.*, 2014], ethyl 4-(3-hydroxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [PUGCIE (**II**); Mookiah *et al.*, 2009], (*RR,SS*)-methyl 4-(2,4-chlorophenyl)-2,7-dimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate (*RS,SR*)-methyl 4-(2,4-chlorophenyl)-2,7-dimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [UCOLOO (**III**); Linden *et al.*, 2006], ethyl 2,7,7-trimethyl-4-(1-methyl-1*H*-indol-3-yl)-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [NEQMON (**IV**); Öztürk Yıldırım *et al.*, 2013], (+/-)-methyl 4-(2,3-difluorophenyl)-2,6,6-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [DAYJET (**V**); Linden *et al.*, 2005], benzyl 4-(3-chloro-2-fluorophenyl)-2-methyl-5-oxo-4,5,6,7-tetrahydro-1*H*-cyclopenta[b]pyridine-3-carboxylate [IMEJOA (**VI**); Linden *et al.*, 2011], and ethyl 4-(5-bromo-1*H*-indol-3-yl)-2,6,6-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate [PECPUK (**VII**); Gündüz *et al.*, 2012].

In (**I**), hydrogen bonds are formed between the N–H group of one molecule and the carbonyl O atom in the cyclohexanone ring of an adjacent molecule. These hydrogen bonds link the molecules into extended chains running along [001]. In the crystal of (**II**), molecules are linked by N–H···O and O–H···O hydrogen bonds into layers parallel to (101). The network includes  $R_4^4(30)$  and  $R_4^4(34)$  graph-set motifs. In (**III**), an intermolecular N–H···O hydrogen bond between the amine group and the carbonyl O atom of the cyclohexanone ring of a neighboring molecule links the molecules into extended chains parallel to [101]. These interactions can be described by graph-set motif C(6). In the crystal of (**IV**), N–H···O hydrogen bonds connect the molecules into C(6) chains parallel to [010], and pairs of weak C–H···O hydrogen bonds link inversion-related chains into a ladder motif through  $R_2^2(18)$  rings. A weak intramolecular C–H···O hydrogen bond is also observed. In (**V**), the crystal structure exhibits an intermolecular N–H···O hydrogen-bonding interaction involving the carbonyl O atom of the oxocyclohexene ring, whereby the molecules are linked into C(6) chains parallel to [100]. In (**VI**), the frequently observed intermolecular N–H···O hydrogen bond between the amine group and the carbonyl O atom of the oxocyclopentene ring of a neighboring molecule links the molecules into extended C(6) chains

parallel to [010]; there are no other significant intermolecular interactions. In the crystal of (**VII**), molecules are linked by pairs of N–H···O hydrogen bonds, forming dimers with  $R_2^1(6)$  ring motifs. These dimers are connected by N–H···O hydrogen bonds, generating chains along [110]. A C–H···O contact occurs between the independent molecules.

## 6. Synthesis and crystallization

The title compound was synthesized *via* a Hantzsch reaction. 4,4-Dimethylcyclohexane-1,3-dione (1 mmol), [1,1'-biphenyl]-4-carbaldehyde (1 mmol), *tert*-butyl acetoacetate (1 mmol), and ammonium acetate (5 mmol) were refluxed for 8 h in absolute methanol (10 ml). The reaction mixture was monitored by TLC, and after completion of the reaction was cooled to room temperature. The obtained precipitate was filtered and recrystallized from ethanol for further purification. The synthetic route is shown in Fig. 7.

## 7. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 4. All C-bound H atoms were positioned geometrically and allowed to ride on their parent atoms, with C–H = 0.95 Å for aryl-H atoms, C–H = 0.99 Å for methylene groups, C–H = 1.00 Å for methine groups and C–H = 0.98 Å for methyl groups, with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl groups and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for other hydrogen atoms. The H atoms of the NH groups were found in a difference-Fourier map and refined freely (see Table 1).

In molecule *C*, except the fused carbon atoms (C4C and C9C) and the carbonyl oxygen atom (O1C) of the 6,6-dimethylcyclohex-2-en-1-one group (**C4C–C5C/C5F–C6C/C6F–C7C/C7F–C8C/C8F–C9C–O1C–C16C/C16F–C17C/C17F**), the other C atoms are disordered over two sets of sites with a refined occupancy ratio of 0.716 (4):0.284 (4). For the disordered components, the EADP instruction was used in the final cycles of the refinement.

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
