Supporting information: this article has supporting information at journals.iucr.org/e

The reaction of $[(C_6H_{11})_2N]_3Ti-CH_3$ with the Lewis acid $B(C_6F_5)_3$, followed by addition of the Lewis bases $(C_6H_5)_3PO$ and $p\text{-F—}C_6H_4CN$ led to the complex salts tris(dicyclohexylamido)(triphenylphosphine oxide)titanium methyltris(pentafluorophenyl)borate toluene sesquisolvate, $[(Ti(C_{12}H_{22}N)_3(C_{18}H_{15}OP)]-(C_{19}H_{3}F_{15}B)\cdot 1.5C_7H_8$, (1), and tris(dicyclohexylamido)(4-fluorobenzonitrile)titanium methyltris(pentafluorophenyl)borate toluene sesquisolvate, $[(Ti(C_{12}H_{22}N)_3(C_7H_4FN)](C_{19}H_{3}F_{15}B)\cdot 1.5C_7H_8$, (2), both crystallizing with 1.5 equivalents of toluene solvent molecules. The Lewis acid–base adducts (1) and (2) can be described by dative donor bonds. The packing of the complex cations, anions and solvent molecules in the crystal structure is consolidated by an intricate three-dimensional network of non-classical C—H···F interactions. Disorder of some of the cyclohexyl groups and the toluene solvent molecules is observed.

1. Chemical context

Highly electrophilic d^0 cations of group 4 metals are known as strong Lewis acids (Bochmann, 2010). Among various other applications, Lewis acids are used in reactions to activate small molecules or in the catalysis of chemical reactions (Corma & García, 2003). The use of a Lewis acid in a catalytic reaction requires knowledge of its strength (Greb, 2018). There are now many different ways of determining the Lewis acidity of a compound. The best known is the Gutmann–Beckett method (Mayer *et al.*, 1975). Another possibility is the use of *para*-fluorobenzonitrile (Künzler *et al.*, 2019). In this context, we report here syntheses and crystal structures of the Lewis acid–base adducts derived from Ti^{IV} as the Lewis acid, $\{[(C_6H_{11})_2N]_3TiOP(C_6H_5)_3\}^+ [H_3CB(C_6F_5)_3]^- \cdot 1.5C_7H_8$ (1) and $\{[(C_6H_{11})_2N]_3TiNC_7H_4F\}^+ [H_3CB(C_6F_5)_3]^- \cdot 1.5C_7H_8$ (2).

2. Structural commentary

In compound (1), the titanium(IV) atom is coordinated by three N atoms and one O atom in a slightly distorted tetrahedral fashion (Fig. 1) with bond angles around titanium(IV) ranging from $105.94 (4)$ to $112.06 (4)^\circ$. The $\text{Ti}-\text{O}$ bond length [$1.9782 (8)$ \AA] is in the range of a single bond (1.99 \AA), similar to titanium–triphenylphosphane adducts (Pyykkö & Atsumi, 2009; Brock *et al.*, 1985). The $\text{Ti}-\text{O}-\text{P}$ angle amounts to $170.99 (5)^\circ$ and thus indicates a bonding situation deviating only slightly from linearity. As a result of the coordination of the triphenylphosphine oxide ligand to the central titanium atom, the $\text{O}-\text{P}$ bond [$1.5269 (8)$ \AA] is widened compared to the $\text{O}-\text{P}$ bond in the free phosphine oxide [1.491 \AA ; Brock *et al.*, 1985]. The angular sums around the nitrogen atoms reveal a trigonal-planar environment in each case, with values of 359.9° for N1, 359.7° for N2 and 360.0° for N3 (using only the major component of the disordered ligand for calculation).

In compound (2), the titanium(IV) atom is coordinated by four N atoms in a likewise slightly distorted tetrahedral fashion (Fig. 2) with bond angles around titanium(IV) ranging from $104.66 (4)$ to $113.62 (4)^\circ$. The $\text{Ti}1-\text{N}4$ bond length of $2.1608 (9)$ \AA to the $\text{N}\equiv\text{C}$ group of the *para*-fluorobenzonitrile ligand is in the range of a dative bond (Pyykkö & Atsumi,

Computer programs: *APEX3* and *SAINT* (Bruker, 2018), *SHELXS* (Sheldrick, 2015a), *SHELXL* (Sheldrick, 2015b) and *publCIF* (Westrip, 2010).

three-dimensional network of non-classical C—H···F interactions is formed in the crystals of (1) and (2), involving the C—H groups of both cations and solvent molecules as donors, and some F atoms of the $[\text{H}_3\text{CB}(\text{C}_6\text{F}_5)_3]^-$ anions as acceptors (Figs. 3, 4). Numerical data of these interactions are compiled in Tables 1 and 2.

4. Synthesis and crystallization

All reactions were carried out under a dry nitrogen atmosphere using Schlenk techniques or in a glove box. Solvents were dried according to standard procedures over Na/K alloy with benzophenone as an indicator and distilled under a nitrogen atmosphere. The cationic titanium complex was synthesized by reacting tris-(dicyclohexylamido)methyl-

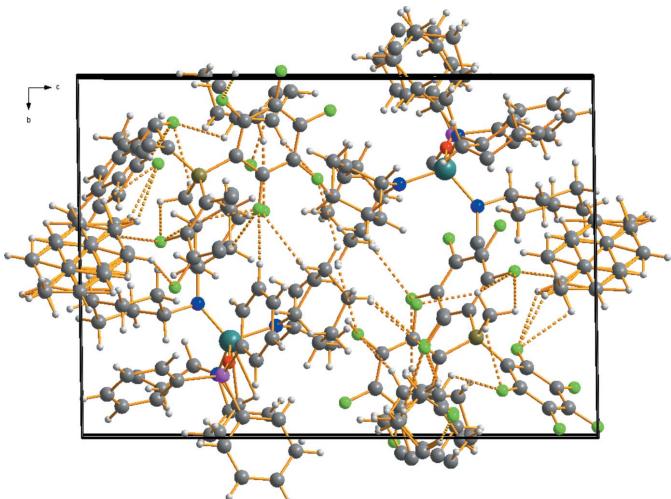

Figure 3

A view along the a axis showing the packing of individual molecules in the crystal of (1), with C—H···F bonds shown as dashed lines. Both components of the disorder are shown. Colour code: C dark grey, H light grey, N blue, Ti teal, B dark yellow, F bright green.

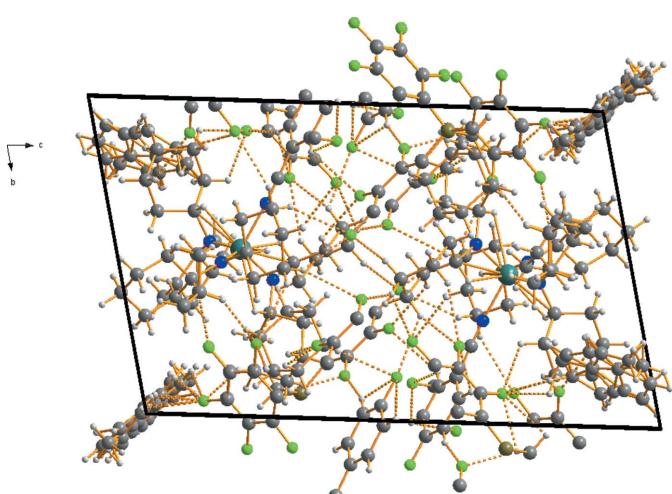

Figure 4

A view along the a axis showing the packing of individual molecules in the crystal of (2), with C—H···F bonds shown as dashed lines. Both components of the disorder are shown. Colour code: C dark grey, H light grey, N blue, Ti teal, B dark yellow, F bright green.

titanium and tris-pentafluorophenylborane (Adler *et al.*, 2016). The cationic titanium complex was dissolved in 3 ml of toluene, the respective base added and stirred at room temperature for 16 h. Afterwards, the solvent was removed by evaporation. Single crystals of compound (1) and (2) were obtained from a saturated solution of toluene at 243 K.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. Hydrogen atoms attached to carbon were placed in idealized positions and refined with a riding model. Compound (1) shows disorder of one cyclohexyl residue (C25 to C30), located at N3, over two sets of sites, with refined site occupancy factors 0.87:0.13. Compound (2) shows disorder of two of the six cyclohexyl residues (C7–C12; C32–C36), located at the N1 and N3 atoms, respectively, with refined site occupancy factors of 0.76:0.24 and 0.85:0.15. No restraints or constraints were applied during the refinement of this kind of disorder. All non-H atoms were refined anisotropically with the exception of the minor components of the disordered parts, which have been refined isotropically. In addition, the toluene solvent molecule in compounds (1) and (2) are disordered. In (1), one toluene molecule (C81–C87) is equally disordered over an inversion centre, and one (C74–C80) over two sets of sites, with refined site occupation factors of 0.764 (4):0.236 (4). In (2), one toluene molecule (C63–C69) is disordered over two sets of sites, the site occupancy was

constrained to 0.5 for each component. The other toluene molecule (C70–C76) is disordered over two sets of sites with refined occupation factors of 0.29 (3):0.210 (3), both of which are additionally disordered over an inversion centre, resulting in a disorder over four sites.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Data collection

Bruker APEXII CCD	26559 independent reflections
diffractometer	20132 reflections with $I > 2\sigma(I)$
Radiation source: sealed tube	$R_{\text{int}} = 0.039$
φ and ω scans	$\theta_{\text{max}} = 33.7^\circ, \theta_{\text{min}} = 1.6^\circ$
Absorption correction: multi-scan (SADABS; Krause <i>et al.</i> , 2015)	$h = -18 \rightarrow 18$
$T_{\text{min}} = 0.963, T_{\text{max}} = 1.000$	$k = -20 \rightarrow 20$
146764 measured reflections	$l = -33 \rightarrow 33$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.044$	H-atom parameters constrained
$wR(F^2) = 0.118$	$w = 1/[\sigma^2(F_o^2) + (0.050P)^2 + 1.3P]$
$S = 1.02$	where $P = (F_o^2 + 2F_c^2)/3$
26559 reflections	$(\Delta/\sigma)_{\text{max}} = 0.002$
979 parameters	$\Delta\rho_{\text{max}} = 0.74 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.96 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
