The dinuclear oxidovanadium(IV/V) complex, $[\text{V}_2(\text{HS}_2\text{O}_8)\text{O}_3(\text{C}_{18}\text{H}_{24}\text{N}_2)_2] \cdot \text{CH}_3\text{CN}$ or $[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-tBubpy})_2] \cdot \text{CH}_3\text{CN}$ (4,4'-*t*Bubpy = 4,4'-di-*tert*-butyl-2,2'-bipyridine), has crystallographic C_2 symmetry and exhibits a distorted octahedral geometry around the vanadium center, where the two 4,4'-*t*Bubpy ligands are nearly orthogonal to each other. The two vanadium ions are linked by an oxo anion and a unique protonated sulfate anion $[\text{H}(\text{SO}_4)_2]^{3-}$. In the crystal, intermolecular $\text{C}-\text{H} \cdots \pi$ and $\pi-\pi$ interactions between the 4,4'-*t*Bubpy ligands are present, leading to a three-dimensional network.

1. Chemical context

The sulfate anion (SO_4^{2-}) plays an important role as a ligand for transition-metal compounds, including polyoxometalates (Walsh *et al.*, 2016), metal sulfates (Natarajan & Mandal, 2008), and polynuclear complexes with organic ligands (Papatriantafyllopoulou *et al.*, 2009). Based on these compounds, a variety of catalysts (Wang *et al.*, 2021), magnetic materials (Gómez-García *et al.*, 2016), and metal–organic frameworks (Mi *et al.*, 2022) have been developed in recent years. A hydrogensulfate anion (HSO_4^-) is also found in transition-metal compounds, and HSO_4^- more often acts as a counter-anion than as a ligand (Díaz-Torres & Alvarez, 2011). Thus, transition-metal complexes having an HSO_4^- ligand are still limited in number. In sulfated metal oxide catalysts (*e.g.*, V_2O_5 -based catalysts), however, a surface-protonated sulfate group is often proposed as a Brønsted acid site and affects the catalytic activity (Xie *et al.*, 2021). Hence, a transition-metal complex having a protonated sulfate anion as the ligand is expected to be an appropriate model compound to understand the active site of sulfated solid catalysts at the molecular level. Herein, we report the crystal structure of a dinuclear oxidovanadium(IV/V) complex with 4,4'-di-*tert*-butyl-2,2'-bipyridine (4,4'-*t*Bubpy) ligands, the two vanadium ions of which are linked by an oxo anion and a unique protonated sulfate anion $[\text{H}(\text{SO}_4)_2]^{3-}$.

2. Structural commentary

A single-crystal X-ray structure analysis revealed a novel dinuclear oxidovanadium(IV/V) complex $[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-tBubpy})_2]$ (V_2) with crystallographic C_2 symmetry (Fig. 1). Complex V_2 exhibits a distorted octahedral geometry around the vanadium centre, where the two 4,4'-*t*Bubpy ligands are nearly orthogonal to each other [the

Table 1

BVS calculations for vanadium atoms of $[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-Bubpy})_2]$ (\mathbf{V}_2).

BVS calculations were conducted using X-ray data of $[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-Bubpy})_2]$. Bond-valence parameters: $\text{V}^{\text{IV}}\text{-O}$ (1.784 Å), $\text{V}^{\text{V}}\text{-O}$ (1.803 Å), and V-N (1.86 Å) (Brese & O'Keefe, 1991).

$[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-Bubpy})_2]$	V1
V(IV)	4.41
V(V)	4.59

dihedral angle between the coordination planes of N1-V1-N2 and $\text{N1}^i\text{-V1}^i\text{-N2}^i$ is $86.48(8)^\circ$. The two vanadium ions are linked by bridging O^{2-} and $\text{H}(\text{SO}_4)_2^{3-}$ ions. The lengths of the $\text{V}=\text{O}_{\text{terminal}}$ [V1-O1 ; 1.5932 (14) Å], $\text{V-O}_{\text{bridging}}$ [$1.8268(7)\text{-}2.2827(12)$ Å], and V-N [$2.1077(14)\text{-}2.1399(14)$ Å] bonds are within the expected values reported in the literature (Triantafyllou *et al.*, 2004; Inoue *et al.*, 2018). For the S-O distances in the $\text{H}(\text{SO}_4)_2^{3-}$ ion, the distances between S1 and O atoms (O3 and O5) attached to V atom are in the range of 1.4654 (13) to 1.5098 (12) Å, whereas the $\text{S}=\text{O}_{\text{terminal}}$ [S1-O4 ; 1.4391 (13) Å] bond is substantially shorter. Although, like the O4 atom, the O6 atom is not attached to the V atom, the S1-O6 distance [1.5066 (13) Å] is comparable in length to the S1-O3 distance. Therefore, the S1-O6 distance can be attributed to the S-OH bond (Leszczyński *et al.*, 2012). The hydrogen atom of the $\text{H}(\text{SO}_4)_2^{3-}$ ligand is located with 0.5 occupancy at two positions (H6 and H6^i) (Schindler & Wickleder, 2017) related by the C_2 axis passing through the midpoint of $\text{O6}\cdots\text{O6}^i$ and the O2 atom. In addition, the $\text{O6}\cdots\text{O6}^i$ distance (2.48 Å) reflects the strong intramolecular hydrogen-bond interaction in the $\text{H}(\text{SO}_4)_2^{3-}$ ligand (Cleland *et al.*, 1998).

Bond-valence-sum calculations of complex \mathbf{V}_2 (Table 1) suggest that the two V atoms (V1 and V1^i) are in a mixed-valence state of V^{4+} and V^{5+} . In addition, the UV-vis spectrum of \mathbf{V}_2 in CH_3CN shows two weak absorption bands at 553 nm ($\epsilon = 82 \text{ M}^{-1} \text{ cm}^{-1}$) and 669 nm ($\epsilon = 29 \text{ M}^{-1} \text{ cm}^{-1}$), which are considered to be the $d\text{-}d$ bands of V^{4+} (Ballhausen & Gray, 1962; Waidmann *et al.*, 2009). To the best of our knowledge, the dinuclear structure of \mathbf{V}_2 bearing the bridging $\text{H}(\text{SO}_4)_2^{3-}$ ligand is unprecedented, although there are a few examples of vanadium complexes having the protonated sulfate anion (*e.g.*, HSO_4^-) as the ligand (Nilsson *et al.* 2009; Datta *et al.* 2015).

Table 2

Hydrogen-bond geometry (Å, °).

Cg2 is the centroid of the N2/C6-C10 ring.

$D\text{-H}\cdots A$	$D\text{-H}$	$\text{H}\cdots A$	$D\cdots A$	$D\text{-H}\cdots A$
$\text{C14-H14A}\cdots\text{Cg2}^i$	0.98	2.78	3.431 (2)	124

Symmetry code: (i) $-x + 1, -y + 1, -z + 1$.

3. Supramolecular features

In the crystal of \mathbf{V}_2 , intermolecular $\text{C-H}\cdots\pi$ interactions (Karle *et al.*, 2007) between the H14A atom and the pyridine ring of the $4,4'\text{-Bubpy}$ ligand (Table 2), along with intermolecular $\pi\text{-}\pi$ interactions (Janiak, 2000) between the pyridine rings of the $4,4'\text{-Bubpy}$ ligands [$\text{Cg1}\cdots\text{Cg1}^i = 3.7222(13)$ Å, interplanar distance = 3.6034 (16) Å, slippage = 0.933 Å. Cg1 is the centroid of the N1/C1-C5 ring; symmetry code: (i) $-x + \frac{5}{4}, -y + \frac{5}{4}, z$], are present (Fig. 2), forming a three-dimensional network (Fig. 3).

4. Synthesis and crystallization

To a solution of $4,4'\text{-di-}tert\text{-butyl-}2,2'\text{-bipyridyl}$ ($4,4'\text{-Bubpy}$) (269.0 mg, 1.0 mmol) in EtOH (10 mL) was added a solution

Figure 1

Crystal structure of $[\text{V}_2\text{O}_2(\mu\text{-O})(\mu\text{-H}(\text{SO}_4)_2)(4,4'\text{-Bubpy})_2]$ (\mathbf{V}_2) with numbered atoms. Ellipsoids are shown at the 50% probability level. Side view (top) and front view (bottom). The hydrogen atoms of $4,4'\text{-Bubpy}$ ligands are omitted for clarity. Symmetry code: (i) $-x + \frac{5}{4}, y, -z + \frac{5}{4}$. The hydrogen atom of $\text{H}(\text{SO}_4)_2^{3-}$ ligand is located at two positions (H6 and H6^i) with 0.5 occupancy. Selected interatomic distances (Å): V1-O1 1.5932 (14), V1-O2 1.8268 (7), V1-O3 1.9692 (12), V1-O5^i 2.2827 (12), V1-N1 2.1077 (14), V1-N2 2.1399 (14), S1-O3 1.5098 (12), S1-O4 1.4391 (13), S1-O5 1.4654 (13), S1-O6 1.5066 (13), $\text{O6}\cdots\text{O6}^i$ 2.480 (2).

Figure 2

Details of the C–H... π interactions and the π – π interactions between the 4,4'-Bubpy ligands of **V**₂. Cg1 and Cg2 are the centroids of the N1/C1–C5 ring and the N2/C6–C10 ring, respectively. The hydrogen atoms of 4,4'-Bubpy ligands except for H14A, H14B, and H14C are omitted for clarity.

of VOSO₄·5H₂O (126.8 mg, 0.5 mmol) in EtOH (5.5 mL). After stirring for 2.5 h at 313 K, the solution was concentrated under reduced pressure, and the green precipitate was filtered using Et₂O and dried to afford a green powder. Then, the powder was suspended in water, and an aqueous solution of sodium lauryl sulfate was added. After the mixture had been stirred overnight at ambient temperature, the supernatant liquid was separated from a dark-green oily precipitate by decantation, and the precipitate was washed with water. The precipitate was dissolved in an EtOH–Et₂O mixed solvent. After the color of the solution turned from green to orange, it was evaporated, and the precipitate was filtered using Et₂O and dried to afford a yellowish brown solid, which was

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

C6—C7—C8—C15	-177.25 (17)		

Symmetry code: (i) $-x+5/4, y, -z+5/4$.

Hydrogen-bond geometry ($\text{\AA}, ^\circ$)

$Cg2$ is the centroid of the N2/C6—C10 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C14—H14A $\cdots Cg2^{ii}$	0.98	2.78	3.431 (2)	124

Symmetry code: (ii) $-x+1, -y+1, -z+1$.
