

Current Crystallographic Books 1970 through 1981

EDITED BY JOHN H. ROBERTSON

School of Chemistry, University of Leeds, England

The previous *Crystallographic Booklist*, edited by Helen Megaw, was published for the IUCr in 1965;* supplements were published in 1966 and 1972, the latter in *J. Appl. Cryst.* **5** (April, 1972). The present Booklist is *an addition to*, rather than a replacement of, that of Megaw.

The format of this Booklist, different from its forerunners, is intended to maximise convenience and efficiency for the user – not so much to be definitive, but rather to have the greatest practical value.

Crystallography is a large and interdisciplinary field, with many near-neighbour fields. There are many books now, on many different topics. However, the researcher, teacher, or student, who is looking for suitable books, has usually only one subject area, or perhaps three or four related ones in mind at any one time. Accordingly, the 1200 or so entries in this list are divided up into about 30 identifiable subject areas, each of which is then of roughly uniform material and of manageable size. One admitted drawback of this system is that some books, inevitably, are such as to be associated with two (or more) subject areas; here, this difficulty is met simply by the duplication of all such entries. The slightly increased volume of the resulting list is a small price to pay, we believe, for the basic convenience of these segregated subject areas. Within these subject categories, the books are listed alphabetically by author because, within any one area (with the exception of *Tabulations*, perhaps), books are far more commonly referred to by author than by title. The layout which we have adopted is very compact and the device of differing typefaces is used to enable the user to scan up and down the columns quite easily and efficiently, either for **authors**, or for **TITLES**, just as desired.

For each entry in this Booklist, the amount of author information is intended to be enough for the user to locate that book in a library or to order it from a bookseller. Hence the ubiquitous initials. The name of the publisher is given for those who wish to purchase but addresses are not normally given since most booksellers usually know these, except in special cases. The date of publication is always given because this is an important detail in a rapidly moving subject such as ours. (This itself is the main reason for the restriction of this Booklist to the past decade.) Whenever a book has been reviewed in one or other of the IUCr journals (this is so for about half of all titles), the reference to that review is given; since we are referring to these IUCr journals only, we have used the simple abbreviations, A, B and J for the *Acta Cryst.* sections A and B, and *J. Appl. Cryst.*, respectively. Finally, there are, scattered here and there, various comments on the books which are essentially personal ones (for which the IUCr cannot be held responsible), which it is hoped will be helpful to the users of this compilation.

*Prior to Helen Megaw's Booklist (which contained about 1000 entries) a still earlier one was edited by Judith Milledge and Arne Magnéni.

Acknowledgements It was the IUCr Commission on Journals which initiated the production of this Booklist; members of that Commission have contributed useful suggestions as well as titles. The Commission on Crystallographic Teaching (which initiated the first Booklist) was also much interested and, following the XIth Congress at Ottawa, contributed a great deal of material. It was the suggestion of this Commission that the boundaries of the Booklist should be widened to include books in any language (*i.e.* not be limited to the four IUCr official languages). This move delayed production somewhat but has significantly enhanced the international flavour of the resulting list. Contributions were received from all members of that Commission and its Consultants, especially Professor H. von Philipsborn (of Regensburg University, Federal Republic of Germany), who organised this exercise, and most notably from Dr Barbara Oleksyn (of the Jagiellonian University, Kraków, Poland), who submitted by far the largest number of titles from Eastern Europe, including the USSR.

A greater than usual number of volumes has been produced during the past decade, including the 60-YEAR INDEX (1913–1973), published in 1975. The publisher is now Reidel, Dordrecht, The Netherlands. This record of the discovery and development of ED (which should not be confused with the book by **Dobson**, entitled 'ELECTRON DIFFRACTION, 1927–1977', which is *not* a history of the subject) was commissioned by the IUCr, and is remarkable for the number and eminence of its contributing authors.
